

Supply Chain Analysis

Project Description:

In my Power BI project, I analyzed a supply chain dataset to identify the reasons for delivery delays. I cleaned and modeled the data in both Excel and Power BI, created hierarchies using various variables, and visualized the data to highlight the contributing factors. The project showcases my expertise in data modeling, cleaning, and visualization, as well as my ability to derive actionable insights from complex datasets. The analysis revealed that South Africa is the country where products were delivered late most and manufacturing sites in India had the maximum sum of delays, while Aurobindo Pharma Limited was the standout vendor with the maximum sum of delays.
